Flywheel energy storage (FES) works by rapidly spinning a rotor (flywheel) and storing the energy as rotational energy in the system. As a result of the concept of conservation of energy, when energy is withdrawn from the system, the flywheel's rotating speed is lowered; when energy is added to the system, the flywheel's rotational speed

Kinetic Energy (KE) storage is also known as a flywheel energy storage system. It is a mechanical energy storage that contributes to high energy and performance. In this system, KE is conveyed in and out of the flywheel with an electric machine that behaves like a generator or motor based on discharge/charging mode.
