Can a fuel cell be used as an energy storage device?

When used as an energy storage device, the fuel cell is combined with a fuel generation device, commonly an electrolyzer, to create a Regenerative Fuel Cell (RFC) system, which can convert electrical energy to a storable fuel and then use this fuel in a fuel cell reaction to provide electricity when needed.

What are the different energy storage devices?

The various energy storage devices are Fuel Cells, Rechargeable Batteries, PV Solar Cells, Hydrogen Storage Devices etc. In this paper, the efficiency and shortcoming of various energy storage devices are discussed. In fuel cells, electrical energy is generated from chemical energy stored in the fuel.

How do fuel cells work?

Fuel cells are electrochemical devices that convert chemical energy into electrical energy through a controlled redox reaction. They are distinct from batteries in that they require a continuous supply of fuel and oxidant (usually oxygen) to operate, while batteries store their energy internally.

What is a fuel cell?

A fuel cell is an electrochemical conversion device that has a continuous supply of fuel such as hydrogen, natural gas, or methanol and an oxidant such as oxygen, air, or hydrogen peroxide. It can have auxiliary parts to feed the device with reactants as well as a battery to supply energy for start-up.

What can a fuel cell power?

Fuel cells can power anything from tiny microchips to buildings, to buses. The problem with fuel cells is that they are expensive technology compared to what is already in terms of energy storage. The other options are those such as deep cycle batteries. They also take up a lot of space.
