How does a supercapacitor-battery hybrid energy storage system work?

In material-level hybridization, one electrode stores charge via a battery-type Faradaic process with another that uses a capacitive mechanism. The first supercapacitor-battery hybrid energy storage system was based on Li-ion, where the anode was made by nanostructured  $\text{Li}_4\text{Ti}_5\text{O}_{12}$  and the cathode was constructed by activated carbon.
