Energy storage devices are contributing to reducing CO<sub>2</sub> emissions on the earth's crust. Lithium-ion batteries are the most commonly used rechargeable batteries in smartphones, tablets, laptops, and E-vehicles.

Batteries and similar devices accept, store, and release electricity on demand. Batteries use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. For example, logs and oxygen both store energy in their chemical bonds until burning converts some of that chemical energy to heat.
