What is blue energy?

Blue energy, or osmotic energy, is a form of Gibbs free energy that is released through mixing two waterbodies of different salinity concentrations [59, 60]. Being an easily accessible and abundant resource, water has made blue energy a potential substitute for its nonrenewable counterparts, such as fossil fuels and coal.

How can blue energy be harvested?

Blue energy can be harvested by various methods, such as triboelectric nanogenarators[,,,]and membrane-based techniques including pressure retarded osmosis (PRO) and reverse electrodialysis (RED). RED is widely acknowledged to be the preferable option to PRO as it is much less energy demanding [65,66].

Are on-chip micro/nano devices useful in energy conversion and storage?

On-chip micro/nano devices haven't been widely applied in the field of energy conversion and storagedespite their potential. This may be attributed to the complex configurations of energy devices and the immature theoretical models.

Can MOF membranes be used in blue energy harvesting?

MOF composite membranes For practical applications in blue energy harvesting, it is typically desirable to fabricate continuous MOF membranes to harness their potential for highly selective ion transport. However, one significant obstacle lies is the difficulty in synthesizing defect-free and freestanding MOF membranes.

Are alumina nanochannel membranes suitable for blue energy harvesting?

For MOF composite membranes used for blue energy harvesting, it is essential to ensure that the crystallinity of MOFs is not compromised during the fabrication process. Liu et al. used XRD to confirm the successful synthesis of UiO-66-NH 2 on the alumina nanochannel membrane (ANM) substrate, which is in good agreement with the simulated data.

What are the different types of micro/nano on-chip energy storage devices?

Three kinds of micro/nano on-chip energy storage devices are introduced in this section: single nanowire electrochemical devices, individual nanosheet electrochemical devices, and on-chip supercapacitors. The demand for miniature energy storage devices increases their application potential.

Recently, Prussian blue analogues (PBAs)-based anode materials (oxides, sulfides, selenides, phosphides, borides, and carbides) have been extensively investigated in the field of energy ...

As part of European project NEST (Nanowires for Energy Storage), we have developed the electrode and electrolyte designs to produce a micro-supercapacitor via a process compatible with integration in C-MOS microelectronics that can withstand solder reflow (280°C for 40 s).

Prussian blue and its analogues (PB/PBAs) represent a promising community of low cost and high capacity cathode materials for sodium ion batteries. Nevertheless, the synthesis ...

The improved energy storage capability was attributed to reasonably-designed sandwich-like nanofiller: the formation of rGO micro-capacitors raised the dielectric constant of PVDF nanocomposites, while the insulative POSS layer helped to improve its breakdown strength and decrease its dielectric loss. ... With a high surface area, shorter ion diffusion pathways, and high conductivity, MXenes enhance the energy storage characteristics of a supercapacitor. The key to high rate pseudocapacitive energy storage in MXene electrodes is the hydrophilicity of MXenes combined with their metallic conductivity and surface redox reactions.

Energy density as a function of composition (Fig. 1e) shows a peak in volumetric energy storage (115 J cm -3) at 80% Zr content, which corresponds to the squeezed antiferroelectric state from C ...

[43], [44] As a matter of fact, some research groups have made an active exploration on the energy storage performance of the PLZT with different chemical composition and other lead-based relaxor-ferroelectrics like PMN-PT, PZN-PT, PMN-Pb(Sn,Ti)O 3, etc., and got a series of energy density ranging from < 1 J cm -3 to 50 J cm -3, [45], [46 ...

The fast development of the energy storage market, including electronic devices and electric vehicles, is

making continuing demands for higher energy density [1], [2], [3] addition to the usual concerns regarding the range or running time for electric vehicles and electronic devices, "space anxiety" is emerging due to the batteries occupying a very large ...

Currently, realizing a secure and sustainable energy future is one of our foremost social and scientific challenges [1].Electrochemical energy storage (EES) plays a significant role in our daily life due to its wider and wider application in numerous mobile electronic devices and electric vehicles (EVs) as well as large scale power grids [2].Metal-ion batteries (MIBs) and ...

We explore recessed microelectrodes (rME) as a plat­form that allows for a binder-free investigation of Prussian Blue ana­logues (PBA), a family of promising battery materials.

Transforming thin films into high-order stacks has proven effective for robust energy storage in macroscopic configurations like cylindrical, prismatic, and pouch cells.

Energy storage technologies have various applications across different sectors. They play a crucial role in ensuring grid stability and reliability by balancing the supply and demand of electricity, particularly with the integration of variable renewable energy sources like solar and wind power [2]. Additionally, these technologies facilitate peak shaving by storing ...

Advancements in microelectronics and electrical power systems require dielectric polymeric materials capable of maintaining high discharged energy density and ...

The power-energy performance of different energy storage devices is usually visualized by the Ragone plot of (gravimetric or volumetric) power density versus energy density [12], [13]. Typical energy storage devices are represented by the Ragone plot in Fig. 1 a, which is widely used for benchmarking and comparison of their energy storage capability.
