So, different energy storage techniques are utilized to solve this problem. In conventional energy storage systems, chemical energy storage-based lead batteries are used for storage purposes. There are various shortcomings in lead batteries. A large amount of energy cannot be stored in such a small volume.

What are the different types of energy storage technologies?

An overview and critical review is provided of available energy storage technologies, including electrochemical, battery, thermal, thermochemical, flywheel, compressed air, pumped, magnetic, chemical and hydrogen energy storage. Storage categorizations, comparisons, applications, recent developments and research directions are discussed.

Which energy storage methods are based on the type of intermediate energy?

Figure 2.3 shows energy storage methods based on the type of intermediate energy form. The thermochemical ES is intentionally highlighted under thermal energy storage since the thermochemical ES is considered as a chemical ES method in some classifications that are provided in the literature.

What should be included in a technoeconomic analysis of energy storage systems?
