How is power capacity determined in energy storage devices?

To address power fluctuations in each frequency band, the power capacity of each Energy Storage Device (ESD) is determined based on the absolute peak value of the power P_{b-i} in each frequency band, referred to as $\left|P_{b-i}\right|_{\max}$ (either the maximum value $(P_{b-i} - \max)$ or the minimum value $(P_{b-i} - \min)$).
