What are chemical and thermochemical energy storage technologies?

In addition to the conventional chemical fuels, new chemical and thermochemical energy storage technologies include sorption and thermochemical reactions such as ammonia system. The main purpose of large chemical energy storage system is to use excess electricity and heat to produce energy carrier, either as pure hydrogen or as SNG.

What are the different types of chemical energy storage systems?

Some of the chemical storage systems which are not yet commercialised can also be listed, such as hydrated salts, hydrogen peroxide and vanadium pentoxide. It is vital to note that chemical energy storage also includes both electrochemical energy storage systems and the thermochemical energy storage systems.

Where is energy stored in a chemical reaction?

Chemical energy is stored in the chemical bonds of atoms and molecules, which is released when a chemical reaction occurs, and the substance is often changed into entirely different substance. Currently, chemical fuels are the dominant form of energy storage both for electric generation and for transportation.
