How does a PCM store thermal energy?

During phase transition from solid to liquid,PCMs store thermal energy in the form of latent heatby an endothermal process that dissolves the PCM's chemical bonds,and release it exothermally when being cooled to recover its solid state [55,81,82]. PCM then is said to act as a thermal storage .

The materials used for latent heat thermal energy storage (LHTES) are called Phase Change Materials (PCMs) [19]. PCMs are a group of materials that have an intrinsic capability of absorbing and releasing heat during phase transition cycles, which results in the charging and discharging [20].

However, electric heating can cause peaks in electric demand and increase the grid's CO₂ emissions, and therefore buildings utilizing a centralized grid for heating should be designed with embedded storage to level the electric demand.
