A model well adapted for pre-design is generally not useful during the detailed design. The converse is also true, detailed models are not particularly adapted to the pre-design phases because they require that many design choices have already been made beforehand, notably at the level of the structure and architecture of the system to be designed.

Changing power delivery trends, as well as demand side management, can both be achieved based on the energy storage systems being used. A thorough analysis into the studies and research of energy storage system diversity-based on physical constraints and ecological characteristics-will influence the development of energy storage systems immensely.
