

Development prospects of foreign phase change energy storage technology

Are phase change materials useful for thermal energy storage?

As evident from the literature, development of phase change materials is one of the most active research fields for thermal energy storage with higher efficiency. This review focuses on the application of various phase change materials based on their thermophysical properties.

Can phase change energy storage technology be used in New Energy?

This paper mainly studies the application progress of phase change energy storage technology in new energy, discusses the problems that still need to be solved, and propose a new type of phase change energy storage - wind and solar hybrid integration system. The advantages and disadvantages of phase change materials are compared and analyzed.

What are the challenges and prospects of phase change materials (PCMs)?

Finally, the challenges and prospects of PCMs are summarized. Phase change materials (PCMs) for thermal energy storage have been intensively studied because it contributes to energy conservation and emission reduction for sustainable energy use.

Are phase change thermal storage systems better than sensible heat storage methods?

Phase change thermal storage systems offer distinct advantages compared to sensible heat storage methods. An area that is now being extensively studied is the improvement of heat transmission in thermal storage systems that involve phase shift. Phase shift energy storage technology enhances energy efficiency by using RESs.

What are the future prospects of thermal energy storage?

Future prospects include the development of materials for heat storage with better thermal characteristics and microencapsulated PCESM optimization techniques. Table 4 presents current research on TES in buildings. Table 4. Current research on thermal energy storage (TES) in buildings.

What are the advantages of organic phase change energy storage materials?

In general, Organic phase change energy storage materials have many advantages, such as thermal and chemical properties are relatively stable, high enthalpy of phase change, no phase separation and supercooling, non-toxic, low cost, etc.

The large-scale development of energy storage began around 2000. From 2000 to 2010, energy storage technology was developed in the laboratory. Electrochemical energy storage is the focus of research in this period. From 2011 to 2015, energy storage technology gradually matured and entered the demonstration application stage.

Therefore, the development of flexible phase change materials with high energy storage density and excellent mechanical properties has become a research focus in the field [37]. Depending on the choice of flexible material, flexible support materials can be classified into internal molecular supports and external skeletal supports [38], [39 ...

By combining renewable energy systems with energy storage technology, renewable energy penetration is increased and overall system performance improves, while flexibility is provided for grid control and maintenance. Some of the applications of energy storage systems include [94]: o

Abstract: Under the background of carbon neutrality, it is necessary to build a new power system with renewable energy as the main body. Power-side energy techniques receive attention because they are important means of remitting large-scale renewable energy grid-connected pressure. They could smooth generation output of intermittent renewable energy ...

Phase change energy storage (PCES) materials have attracted considerable interest because of their capacity to store and release thermal energy by undergoing phase ...

Thermal energy storage technologies utilizing phase change materials (PCMs) that melt in the intermediate temperature range, between 100 and 220 °C, have the potential to mitigate the intermittency issues of

In the field of construction, as a major energy consumer, the development of energy-saving technology is particularly critical. As an emerging energy-saving technology, phase change energy storage building materials have received extensive attention and research in ...

The cold storage uses n-tetradecane as a phase change cold storage material, with a phase change temperature of 4.29 °C and a phase change latent heat of 216.2 kJ/kg, which meets the temperature requirements of blood and vaccines. A combined foam copper material was developed to optimize the formula and improve the efficiency of the cold storage.

Cold chain logistics refers to systematic engineering in which refrigerated products are stored, transported, distributed, and sold in a suitable low-temperature environment to ensure product quality and safety [2]. The key issue in the application of phase change cold storage in cold chain logistics is the selection of phase change materials [7]. At present, composite phase ...

While TCS can store high amounts of energy, the materials used are often expensive, corrosive, and pose health and environmental hazards. LHS exploits the latent heat of phase change whilst the storage medium (phase change material or PCM) undergoes a phase transition (solid-solid, solid-liquid, or liquid-gas).

As a phase change energy storage medium, phase change material does not have any form of energy itself. It stores the excess heat in the external environment in the form of latent heat and releases the energy under appropriate conditions. Moreover, the temperature of phase-change material is almost constant when phase change occurs [22], [23].

The energy storage heat per unit volume of PCMs is 5 to 14 times that of traditional energy storage, and it has the advantage of high heat storage value [17]. At present, phase change cold storage technology is widely used in new energy [18], industrial waste heat utilization [19], solar energy utilization [20], energy-saving buildings [21] ...

Phase change materials (PCMs) can absorb or release heat for thermal energy storage and utilization, especially the multi-co-production energy storage system [7]. The thermal performance of PCMs depends on the high latent heat, wide phase change temperature range, high thermal stability and high economic performance.

Finally, the development prospects of CCUS-EOR technology are proposed, such as large-scale CO₂ flooding and storage in the whole structure-controlled area, and conversion of CO₂ and residual oil into methane by
