Are lithium-ion batteries cost-effective for long-term energy storage?

Lithium-ion batteries are the technology of choice for short duration energy storage. However, they are not as cost-effective for long duration storage, providing an opportunity for other battery technologies, such as redox-flow or sodium-ion, to be deployed alongside clean technologies such as hydrogen storage. Introduction

Why is battery energy storage important?

Battery energy storage is becoming increasingly important to the functioning of a stable electricity grid. As of 2023, the UK had installed 4.7GW /5.8GWh of battery energy storage systems, with significant additional capacity in the pipeline. Lithium-ion batteries are the technology of choice for short duration energy storage.

Why do we provide funding for battery storage projects?

We provide funding support for projects involving battery storage because the technology helps the grid to remain stable due to its ability to respond to changes in energy demand. Cost-effective battery storage has the potential to significantly assist in operating a power grid with a higher share of renewable energy.

Which batteries are used in energy storage?

Although recent deployments of BESS have been dominated by lithium-ion batteries, legacy battery technologies such as lead-acid, flow batteries and high-temperature batteries continue to be used in energy storage.

Why is lithium ion the most widely deployed energy storage technology?

Although there are a wide range of different battery technologies available for energy storage applications, lithium-ion will be the most widely deployed energy storage technology globally by 2030. There are three main reasons why lithium-ion technology is so dominant: Decreasing cost of manufacture.
