Where will compressed air be stored?

In a Compressed Air Energy Storage system, the compressed air is stored in an underground aquifer. Wind energy is used to compress the air, along with available off-peak power. The plant configuration is for 200MW of CAES generating capacity, with 100MW of wind energy.

Can compressed air be used for large scale energy storage?

Even with potential safety concerns such as vessel ruptures or overheating, the storage of compressed air does not appear to be such an unreasonable method for large scale energy storage given the obvious abundance of air and relatively large amount of underground space available for storage.

What is compressed-air energy storage?

Compressed-air energy storage (CAES) is a technology in which energy is stored in the form of compressed air, with the amount stored being dependent on the volume of the pressure storage vessel, the pressure at which the air is stored, and the temperature at which it is stored. A simplified, grid-connected CAES system is shown in Fig. 14.1 [1].
