

Electric boilers need to be equipped with energy storage devices

What is required to run an electric boiler?

To run an electric boiler, a power source is all you need. You can say goodbye to the increasing costs of gas and oil. Electric boilers are quick and easy to install, as they do not require venting or gas connections. With the continual expansion of wind and solar power plants, electricity is becoming one of the main energy sources in the heating market.

Do electric boilers need a hot water storage cylinder?

Like gas boilers, electric boilers can be either combination (combi) system or heat-only (regular) boilers: Heat up water for your taps and radiators 'on demand'. They don't need external hot water storage cylinders, making them suitable for properties with less space.

What makes electric boilers convenient?

Electric boilers are modern, convenient, safe and ecological heat generators. Our Vitotron series electric boilers offer convenient and reliable space heating without the need for fossil fuels. These small appliances can be installed practically anywhere, providing for plug-and-play ease of installation and simplified programming.

Are electric boilers better than gas boilers?

No carbon emissions from the boiler itself - although remember that it's only as green as the electricity used to power it. Electric boilers are nearly 100% energy-efficient- compared to a like-for-like gas boiler, you need fewer units of energy (kWh) to produce the same amount of heat. Have fewer moving parts - reducing the likelihood of a fault.

Do I need an electric boiler if I have a low heating demand?

If you have a low heating demand, for example you live in a smaller property and/or your home is insulated well (so heat doesn't escape easily), you'll need your heating on for less time and the costs to run an electric boiler may be manageable.

Are electric boilers good for small homes?

This means electric boilers are well-sized for smaller homes but may struggle to meet the heating demands of larger properties, especially if you don't have the space for a heat-only or system boiler, and would have to go for a combi electric boiler.

Some heating and virtually all cooling is electric. Heat can be generated from renewable energy sources in two ways: (a) by direct conversion of renewable energy sources to heat (e.g. solar thermal applications) and (b) by using electricity generated from renewable energy sources to produce heat via heat pump technology or electric boilers.
