C&I users can achieve cost arbitrage by leveraging the price difference between peak and off-peak hours, reducing electricity costs.

How do you calculate power versus energy cost?

Total System Cost (\$/kW) = (Battery Pack Cost (\$/kWh) \times Storage Duration (hr) + Battery Power Capacity (kW) \times BOS Cost (\$/kW) + Battery Power Constant (\$)) / Battery Power Capacity (kW) For more information on the power versus energy cost breakdown, see (Cole and Frazier, 2020).

What is the capacity factor of a battery system?

The cost and performance of the battery systems are based on an assumption of approximately one cycle per day. Therefore, a 4-hour device has an expected capacity factor of 16.7% ($4/24 = 0.167$), and a 2-hour device has an expected capacity factor of 8.3% ($2/24 = 0.083$).
