

Introduction. Energy storage technologies can be classified into different categories based on their conversion/storage approach: chemical including electrochemical (e.g., as in hydrogen, batteries), mechanical (e.g., as in flywheels), electrical including electromagnetic (e.g., as in supercapacitors, superconducting magnetic), and thermal (e.g., as in molten salts).

As shown in Fig. 1, ESSs can be ramified as the electromechanical, electromagnetic, electrochemical and electrostatic [7]. Flywheels and hydro pumped energy storage come under the class of electromechanical ESSs. The super conducting magnetic energy storage (SMES) belongs to the electromagnetic ESSs.

The energy storage in this system occurs due to an electric field between two electrodes [25]. The storage system can store energy as a magnetic field generated, and that is through direct current (DC) that is passed through the superconducting coil. It is quick in response, and the efficiency is high as it is expected to reach 95%.

The rapid expansion of renewable energy sources has driven a swift increase in the demand for ESS [5]. Multiple criteria are employed to assess ESS [6]. Technically, they should have high energy efficiency, fast response times, large power densities, and substantial storage capacities [7]. Economically, they should be cost-effective, use abundant and easily recyclable ...
