How do chillers work?

The video explains the working principle of chillers, commonly used in large buildings. It covers the main components: compressor, condenser, evaporator, and expansion valve, and describes their function. The process involves refrigerant cycling through phase changes to transfer heat and cool water, guided by thermodynamics.

What is the working principle of a chiller?

The video introduces the working principle of chillers, specifically focusing on two main types: air-cooled and water-cooled chillers. Despite the variety, all chillers share the same components and working principle: compressor, condenser, evaporator, and expansion valve. The compressor facilitates refrigerant circulation within the chiller.

How does a vapor absorption chiller work?

Vapor absorption chillers work by using a heat source, such as solar energy or waste heat, to drive the coolant through the system. Unlike traditional chillers, they do not use a compressor. Instead, they use refrigerants to cool process fluids and spaces.

What does an industrial chiller system cool?

If your facility uses process fluids or heavy-duty machinery that generates heat, you'll need an industrial chiller system to cool your processes and internal machine components. Understanding how an industrial chiller works and the various types of chillers available will help you make the right choice for your cooling needs.

What drives the coolant in a vapor absorption chiller?

Vapor absorption chillers use a heat source, e.g. solar energy or waste heat to drive the coolant through the system. This type of chiller uses refrigerants to cool process fluids and spaces. Unlike other chillers, it has no compressor in the unit.

How does thermal energy storage work in district cooling?

Thermal energy storage tanks are often found in district cooling systems. They are usually made of concrete and their physical size is big. So, how does it work in district cooling and what exactly is thermal energy storage? In district cooling, thermal energy storage tanks are used to store cooling energy at night where the electricity is cheaper.
