How many TWh of electricity storage are there?

Today, an estimated 4.67 TWh of electricity storage exists. This number remains highly uncertain, however, given the lack of comprehensive statistics for renewable energy storage capacity in energy rather than power terms.

Is it profitable to provide energy-storage solutions to commercial customers?

The model shows that it is already profitable to provide energy-storage solutions to a subset of commercial customers in each of the four most important applications--demand-charge management, grid-scale renewable power, small-scale solar-plus storage, and frequency regulation.

The further downstream battery-based energy storage systems are located on the electricity system, the more services they can offer to the system at large. Energy storage can be sited at three different levels: behind the meter, at the distribution level, or at the transmission level. Energy storage deployed at all levels

It also lowers risk for customers, because it relieves them of the responsibility and cost of predicting regional peak demand hours and dispatching their systems. Most programs allow customers to opt out of dispatch events without penalty, even though missing these dispatch calls typically lowers the customer's incentive payments for that period.
