What are energy storing and return prosthetic feet?

Energy storing and return prosthetic (ESAR) feet have been available for decades. These prosthetic feet include carbon fiber components, or other spring-like material, that allow storing of mechanical energy during stance and releasing this energy during push-off.

Do energy storage and return feet affect the propulsion of the body?

Hawkins J, Noroozi S, Dupac M, et al. Development of a wearable sensor system for dynamically mapping the behavior of an energy storing and returning prosthetic foot.

Are energy storing and return (ESAR) feet a good choice?

Energy storing and return (ESAR) feet are generally preferredover solid ankle cushioned heel (SACH) feet by people with a lower limb amputation. While ESAR feet have been shown to have only limited effect on gait economy,other functional benefits should account for this preference.

Are energy storage and return feet safe for amputees?

The strain and stress seen in the three tests were within safe limits, while most of the energy was absorbed in the ankle component of the prosthesis. Energy storage and return (ESR) feet have long been assumed to promote metabolically efficient ampute gait.

Are energy storage and return (ESAR) prosthetic feet effective?

The magnitude and the distribution of the energy stored and a series of stress and strain parameters were analysed for the test device using the proposed approach. The novel methodology proposed may act as an effective tool for the design, analysis and prescription of energy storage and return (ESAR) prosthetic feet.

Do energy storage and return feet promote metabolically efficient amputee gait?

Energy storage and return (ESR) feet have long been assumed to promote metabolically efficient amputee gait. However, despite being prescribed for approximately 30 yr, there is limited evidence that they achieve this desired function.

Energy storage and return (ESAR) prosthetic feet are designed to emulate the compliant structures of the anatomical lower-limb via a spring-like construction of carbon fiber [1]. There has been recent debate over whether ESAR prostheses give lower-limb amputee athletes an advantage [2], [3], [4], despite lower-limb amputation generally being associated ...

To account for any uncertainty in joint power and energy estimates caused by the movement or mis-location of the axis of rotation in NA-ESR prosthetic feet, several groups have incorporated translational power terms into their inverse dynamic analyses (Prince et al., 1994, Geil et al., 2000) on the basis of work in the anatomical foot-ankle (Buczek et al., 1994).
