

Which regenerative energy management strategy is best for a tramway?

The adaptive EMS allows better harnessing of regenerative energy than the RB-EMS. In this paper an adaptive energy management strategy (EMS) based on fuzzy logic and the optimal sizing for a tramway with a hybrid energy storage system (ESS) combining batteries (BT) and supercapacitors (SC) are presented.

Is a hybrid ESS a good option for a tramway?

An adaptive EMS (based on fuzzy logic) for a tramway with hybrid ESS is proposed. A sizing approach and optimal battery-supercapacitor combination is presented. The cost model considers initial investment and degradation by cycling of the ESS. The hybrid ESS shows a clear operating cost reduction from the SC-based ESS.

How do BT and SC sizing optimize a tramway?

The sizing optimization is carried out through multi-objective genetic algorithms (GA). The multi-objective approach considers an economic model in order to evaluate the influence of the BT and SC sizing on the operating cost of the tramway in a long term view (whole lifetime of the vehicle).

Does a tramway operate in a catenary-less zone?

The selected case study is the tramway of Seville, which operates in zones with and without catenary. The aim is to minimize the daily operating cost of the tramway taking into account the BT and SC degradation approach (cycling) and fulfilling the performance of the tramway in the catenary-less zone.

How does EMS sizing work?

The EMS applies a sliding window to estimate the forward energy consumption and adapt the instantaneous power target for BT and SC. The hybrid ESS sizing is obtained by an optimization with multi-objective genetic algorithms (GA).

What is adaptive EMS and optimal sizing in regenerative braking?

The proposed approach (adaptive EMS and optimal sizing) is compared with the current solution in the tramway (SC-based) and with a hybrid ESS managed by a rule-based EMS (RB-EMS) in terms of daily operating cost and energy harnessing during regenerative braking phase.

The various benefits of Energy Storage are help in bringing down the variability of generation in RE sources, improving grid stability, enabling energy/ peak shifting, providing ancillary support services, enabling larger renewable ...

To be successful with peak load shifting, a suitable energy storage needs to be incorporated during peak load periods (when the appliance is turned off because of high load) to have a minimum impact on consumers' comfort. In this paper, the application of PCM was investigated to achieve a successful peak load shifting (based on RAC) while ...

Reference [6] developed an active power management scheme for the control of the battery energy storage system based on photovoltaic capacity management and the time energy shifting to shave peak ...

To address these challenges, energy storage has emerged as a key solution that can provide flexibility and balance to the power system, allowing for higher penetration of renewable energy sources and more efficient use of existing infrastructure [9]. Energy storage technologies offer various services such as peak shaving, load shifting, frequency regulation, ...

Peak Shifting What is Peak Shifting?. Peak Shifting is a “demand side management” or DSM strategy that is highly cost-effective method of reducing electric utility expenses. When electric utility commercial or industrial customers use electricity can make a big difference on their monthly electric bills.

This technique can also marry well with solar, reducing the cost of operation during the day and lowering the use of backup energy - fuel and battery - when a site disconnects off the grid. Peak Shifting and Peak Shaving are increasingly ...

Battery energy storage system (BESS) can achieve good effect of energy saving and voltage stabilization in urban rail transit system. In order to make better use of the capacity of the ...

This will help you understand your business energy consumption patterns and pinpoint opportunities for peak shaving. Invest In Energy Storage. Battery storage systems are a key component of peak shaving. They store ...

A VPP is a combination of distributed generator units, controllable loads, and ESS technologies, and is operated using specialized software and hardware to form a virtual energy network, which can be centrally controlled while maintaining independence [9]. An MG is an integrated energy system with distributed energy resources (DER), storage, and multiple ...

Energy storage, recognized as a way of deferring an amount of the energy that was generated at one time to the moment of use, is one of the most promising solutions to the aforementioned problem (Chen et al., 2009, European Commission 2016). Grid-scale energy storage involves the conversion of electrical energy to another form of energy that can be ...

In this paper, the effect to public electric transportation tram fast charging in the power distribution system was studied by a focus on voltage profile and power loss. Optimal strategy of ESS for ...

Load shifting aims at taking advantages of electricity rate difference between different periods via shifting on-peak load to off-peak hour, as shown in Fig. 2. The cooling stored in off-peak hour is used to partially/completely offset the on-peak load. ... (BTM), load shifting using thermal energy storage system (TES), load shifting using both ...

Energy storage can facilitate both peak shaving and load shifting. For example, a battery energy storage system (BESS) can store energy generated throughout off-peak times and then discharge it during peak times, aiding in both peak ...

The value of long-duration energy storage, which helps address variability in renewable energy supply across days and ... demand shifting and peak reduction; spinning and non-spinning reserves; and seasonal energy shifting (Sto, 2014; Akhil et al., 2016). Numerous cost assessments are available for energy storage technologies. For example,

This article delves into the distinction between load shifting and peak shaving, elucidating their positive impacts when integrated with BESS technologies. Load Shifting vs. Peak Shaving. Load shifting and peak shaving ...

This paper proposes the constant and variable power charging and discharging control strategies of battery energy storage system for peak load shifting of power system, and details the ...

The energy situation and sustainable development have been attached numerous attention in recent decades. The complementary integration of multiple energy carriers has become a significant approach to improve the current energy structure and alleviate the supply-demand contradiction [1] pared with the conventional supply mode, the integrated energy ...

Therefore, aiming at the lithium battery / super capacitor hybrid energy storage system for tram, a new dynamic power distribution method is proposed by introducing road ...

Therefore, V2G is a promising alternative to the stationary ESS for providing energy storage to an electrified light-rail and tram system. Therefore, this paper firstly investigates the energy balance of the Sheffield Supertram system based on a common OCS configuration and compares it to its separate OCS configuration (Section 2).

In this comprehensive paper, the various methods and technologies that were proposed for regenerative energy recuperation have been analyzed, investigated, and ...

This paper investigates an ESS based on supercapacitors for trams as a reliable technical solution with considerable energy saving potential. Operating the ESS onboard a tram brings the following benefits: reduction of peak power demands, decrease of power ...

The energy balance of separate and common OCS has been well investigated, but there exists little research that directly compares the energy balances based on the same light-rail or tram system. An energy storage system (ESS) is considered as an effective measure to improve regenerative

The ESS can perform peak shifting to reduce or eliminate the peak demand. The peak shifting plays a role to reduce the cost of the power distribution by reducing supplied power from the utility during peak time as shown in Fig. V. The ESS can store energy during light load and can provide the energy during peak load demand [6].

voltage was converted to DC voltage for charging tram battery [5]. C. Energy management (Peak shifting) An ESS is useful for the energy management and the stability improvement of the power distribution system. Peak shifting is a technique using to mitigate load fluctuations for enhancing the power quality which can manage by the ESS. The

In this study, a significant literature review on peak load shaving strategies has been presented. The impact of three major strategies for peak load shaving, namely demand side management (DSM), integration of energy storage system (ESS), and integration of electric vehicle (EV) to the grid has been discussed in detail. Discussion on possible challenges and ...

The common on-board energy storage system of trams includes a battery system, a supercapacitor system, a flywheel system, a hybrid system of an internal combustion

Industrial and commercial user with an on-site Battery Energy Storage System can benefit from load shifting without altering business operations. For example, a manufacturing facility can reduce its electricity bill ...

Traction power fluctuations have economic and environmental effects on high-speed railway system (HSRS). The combination of energy storage system (ESS) and HSRS shows a promising potential for utilization of regenerative braking energy and peak shaving and valley filling. This paper studies a hybrid energy storage system (HESS) for traction substation ...

In TES systems, energy could be stored in three forms: sensible heat, latent heat and thermochemical energy storage [8,9]. Although latent and thermochemical storage systems have higher storage density, sensible storage, which stores energy by changing the temperature of a storage medium (e.g. water, bricks, clay, concrete, etc.), is widely adopted due to the ...
