How to save energy in dyeing process?

Use of solar energy for de-sizing and scouring enables almost 40-50% energy saving. Cold pad batch method for reactive dyeing by sodium silicate for fixation of kthe dyestuff gives 100% energy saving. Rapidogen development by dry heat fixation with compounds like urea uses no acid ager and hence saves 40% energy.

How much energy does the textile industry use?

The textile industry retains a record of the lowest efficiency in energy utilization and is one of the major energy-consuming industries. About 34% of energy is consumed in spinning, 23% in weaving, 38% in chemical processing, and another 5% for miscellaneous purposes.

How do textile mills save energy?

It is known that thermal energy in textile mills is largely consumed in two operations, in the heating of water and drying of water. Fuel consumption in textile mills is almost directly proportional to the amount of water consumed. Hence, if the consumption of water can be reduced, it will also save energy.

What percentage of energy is consumed in spinning/weaving?

About 34% of energy is consumed in spinning,23% in weaving,38% in chemical processing, and another 5% for miscellaneous purposes. Power dominates the consumption pattern in spinning/weaving, while thermal energy is major for chemical processing.

Why is energy important?

Energy is one of the most important ingredients in any industrial activity. However, its availability is not infinite. The Global Energy crisis, as well as the high cost of fuels, resulted in more activities to conserve energy to the maximum extent.

Water, the universal dyeing media poses various problems like, waster water load, inability in complete dissolution of dye and chemicals, post-dyeing drying, etc., which makes the technology of ...

The investigation also showed that wet textile processes, including bleaching, dyeing, printing, and finishing, use 3600 dyes and 8000 chemicals . Therefore, ... Figure 4 demonstrates the KPI of 15 factories based on energy ...

Printing and dyeing wastewater is the aqueous effluent released by factories that operate the dyeing and finishing of wool and silk, among other things. ... about 0.3 million tons are discharged without proper treatment [9]. Printing and dye wastewater (PDW) is the aqueous effluent released by factories that operate the dyeing and finishing of ...

Computers are used increasingly in dyeing processes to formulate and match colors with greater speed and

accuracy. Printing. Printing colored designs on cotton cloth is similar to printing on paper. Long runs of the same fabric design ...

9. Solution Pigmenting or Dope Dyeing: This is a method applied for dyeing the synthetic fibers. Dye is added to the solution before it is extruded through the spinnerets for making synthetic filaments. This gives a colorfast ...

The textile industry, a substantial component of the global economy, holds significant importance due to its environmental impacts. Particularly, the use of water and chemicals during dyeing processes raises concerns in the context of climate change and environmental sustainability. Hence, it is crucial from both environmental and economic ...

CHTC Fong's innovations in smart dyeing. CHTC Fong?s has been committed to the development and manufacturing of dyeing and finishing equipment for more than 50 years. In the past decades, CHTC Fong?s ...

9. The heating-energy-saving equipment for printing and dyeing factory according to claim 1, wherein a first heat exchanger is arranged on the steam discharge port of the setting machine, the cold air input pipe is connected to an air inlet of the first heat exchanger through a fan, and an air outlet of the first heat exchanger is connected to an inner cavity of the setting ...

Abstract: This work highlights the potential of advanced printing techniques, such as 3D, spray, screen, and inkjet printing, in revolutionizing the way of implementing energy storage ...

China's textile industry is a high energy consumption, high water consumption and high pollution. So do the energy-saving emission reduction is particularly important for printing ...

However, its amount was insignificant in the garment washing and dyeing factories. Table 1: Average waste generation (t/year) Waste Types Medium scale Fabric mills (FMM) Large Scale Fabric Mills (FML) Medium Scale Garment Washing and Dyeing (GWM) Large Scale Garment Washing and Dyeing (GWL) Chemical Containers 2.6 8.8 3.5 7.2

The specific electrical energy consumption per kg dye removed (E(dye)) in optimal conditions for real effluent was calculated. 170 kWh/kg(dye) was required for a reactive dye, 120 kWh/kg(dye) for ...

Actual printing and dyeing wastewater (APDW), which is the wastewater discharged during the production processes of printing and dyeing factories and textile mills. Many compounds such as dyes, additives, and alkalis are contained in these complex wastewaters, resulting that the APDW are difficult to treat.

CHTC Fong"s has been committed to the development and manufacturing of dyeing and finishing equipment

for more than 50 years. In the past decades, CHTC Fong"s devoted to the development of energy-saving ...

A heating-energy-saving equipment for printing and dyeing factory, including: a heat source generator, a first ejector, a second ejector, a setting machine and a flash drum; a ...

In the resist printing method, initially, a resist paste is applied in the desired printing pattern. Then dye is applied onto the fabric. The resist paste applied parts of fabric are not colored. In the discharge printing, the dye is applied on the fabric after, that a discharge paste is printed on the fabric.

In order to choose a boiler that is most suitable for the printing and dyeing industry, certain factors must be considered. This article will discuss those factors in detail. E-mail: ... Thermal Energy-Saving Measures for Textile Printing ...

By adopting water-saving and energy-efficient methods, such as cold water dyeing, air dyeing, solar dyeing, and digital printing, the industry can significantly reduce its environmental footprint. The benefits of low-impact ...

Printing and dyeing, as a high energy consumption and high pollution industry, how to produce Energy conservation and emission reduction in the process are the focus of the ...

The need for energy conservation has assumed importance due to the rapid growth of process industries causing substantial energy consumptions ... Elimination of curing in printing saves 100% electrical input for curing step. ...

Three companies in Keqiao district, Shaoxing, East China''s Zhejiang province were ranked among China''s top 30 dyeing companies, according to an annual list recently released by the China Dyeing and Printing Association. They were Zhejiang Baofang Printing and Dyeing Co Ltd, RGB Textile, as well as Zhejiang Yingfeng Technology Co Ltd.

Textile industry, closely related to people"s livelihood and global economy, consumed tremendous water resource and produced a large amount of textile wastewater synchronously [1], [2].Wherein, printing and dyeing wastewater (PDW) accounts for approximately 70-80 % of total volume and contaminants [3].Aniline as a ubiquitous toxic organic pollutant in ...

In fact, the printing and dyeing industry can save energy from the following four aspects. 1. Energy saving of boiler system. 2. Energy saving of heating system. 3. Energy ...

In order to solve the problem with the expansion of the industrial scale, the contradiction between energy resources and development of printing and dyeing enterprises ...

Through the implementation of some very simple but effective solutions for energy saving in the Printing Industry, substantial savings can made. Overall Base Load - experience has shown us that on average, whilst ...

The printing and dyeing process is a crucial aspect of the textile industry, with printing and dying wastewater (PDWW) constituting about 80 % of the entire textile industry's wastewater and 20 % of the total global industrial wastewater (Liu et al., 2022; Yukseler et al., 2017). Presently, there are two primary formats for printing and dyeing ...

Dividing the discharge stream from the dyeing process at another factory 33 Figure 19. Low MLR Jet dyeing machine 37 Figure 20. High MLR Jet dyeing machine 37 Figure 21. Low MLR washing machine 40 Figure 22. Cotton dyeing diagram by cold pad batch dyeing technology [8] 44 Figure 23. Ozone G2 machine can be operated in dry and wet conditions 48 ...

Energy consumption is rising constantly in China with the process of accelerating urbanization and industrialization [1].Carbon emission reduction and energy efficiency improvement are important means for the government to cope with climate change [[2], [3], [4]].A bulk of fuel, power, and water are applied in the textile industry while accompanying with ...

printing and dyeing value chain by establishing communication between upstream and downstream companies, and promoting green technology, products and service providers. Digital printing product and technology were introduced to the Chinese market to increase the efficiency of printing and dyeing companies.

Sweden-based imogo AB is another newcomer to the dyeing industry with its Dye-Max spray dyeing technology. Imogo partnered with ACG Kinna, Sweden, to build the first Dye-Max line, and the technology made its ...

Textile, printing, and dyeing industries in China are expanding annually, resulting in the discharge of significant volumes of wastewater. These effluents have complex compositions and contain diverse pollutants that pose severe hazards to aquatic systems, ecological environments, and nearby flora, fauna, and human populations. The inadequate or ...

It refers to both the dyeing and printing process. Dyeing is the specific colouration of textiles, while printing is the localized application of colourants by a suitable method base on the design ...
