## Energy storage is also divided into various technical types

ESSs can be divided into two groups: high-energy-density storage systems and high-power storage systems. High-energy-density systems generally have slower response times but can supply power for longer. In contrast, high-power-density systems offer rapid response times and deliver energy at higher rates, though for shorter durations [27, 28].

Based on their discharging durations, energy storage systems can also be divided into short-term storage systems (up to a day) and long-term storage systems (up to several years). Investment costs for storage, charging or discharging technologies are given either in terms of power in EUR/kW or of capacity in EUR/kWh.
