Chemical energy storage mainly includes hydrogen storage and natural gas storage. In hydrogen storage, hydrogen is produced through direct or electrolytic methods, with electrolysis of water being a common method. The energy required for this process also needs to be provided by other fossil fuels or RE sources [39,

In most seasonal thermal energy storage systems, the PCMs mainly play an auxiliary role and do not act as the main thermal storage medium. There are two ways to use PCMs as seasonal thermal energy storage media, one is the direct-type, which directly uses the performance of PCMs, and the other we can call the supercooling-type, that is, using ...

Energy storage systems can improve the performance of the power grid, controlling the frequency, upgrading the transmission line capability, mitigating the voltage fluctuations and improving the power quality and reliability [6]. In essence, energy storage increases the flexibility of how we generate, deliver and consume electricity.

The flywheel energy storage system mainly stores energy through the inertia of the high-speed rotation of the rotor. In order to fully utilize material strength to achieve higher energy storage density, rotors are increasingly operating at extremely high flange speeds.
