The recent developments in deep space exploration and new energy transition cover many critical topics on cryogenic fluids, including cryogenic propellant management, optimal energy conservation, and large-scale energy storage and transportation, as shown in Fig. 1. For example, liquid methane and liquid oxygen are regarded as one of the most promising ...

Natural gas is liquefied at temperatures as low as $-162\text{ }^{\circ}\text{C}$. LNG is a mixture of light and heavy hydrocarbons, such as methane, ethane, propane, and n-butane, and other species, such as carbon dioxide and nitrogen [5]. The large temperature gradient between the environment and the LNG inside a storage tank, enables heat transfer that evaporates a portion of LNG and ...

The energy losses for a LAES storage tank can be estimated to be around 0.1-0.2% of the tank energy capacity per day, which makes the LAES suitable as a long-term energy storage system. The effect of the storage pressure was investigated for a microgrid scale by Borri et al. [36]. The results showed that by increasing the storage pressure ...
