Conclusion At present, energy storage technologies applied in hydraulic wind turbines mainly focus on hydraulic accumulators and compressed air.

How is energy stored in a hydraulic system?

The energy in the system is stored in (E) hydraulically or pneumatically and extracted from (E) when necessary. Since hydraulic pumps/motors tend to have a higher power density than pneumatic compressors/expanders, the hydraulic path is usually used for high-power transient events, such as gusts or a sudden power demand.
