What is dynamic programming in energy storage system planning?

To address the issues of limited Energy Storage System (ESS) locations and the flexibility unevenly distributed in the large-scale power grid planning, this paper introduces the Dynamic Programming (DP) theory into flexibility planning, and proposes a DP-based ESS siting and sizing method.

How flexible is the energy storage system?

To address these challenges, the future power system must have sufficient flexibility. The Energy Storage System (ESS) is an important flexible resource in the new generation of power systems, which offers an efficient means to address the high randomness, fluctuation, and uncertainty of grid power.

Are energy storage systems a key element of future energy systems?

At the present time, energy storage systems (ESS) are becoming more and more widespread as part of electric power systems (EPS). Extensive capabilities of ESS make them one of the key elements of future energy systems [1,2].

Are energy storage systems a part of electric power systems?

The share of global electricity consumption is growing significantly. In this regard, the existing power systems are being developed and modernized, and new power generation technologies are being introduced. At the present time, energy storage systems (ESS) are becoming more and more widespread as part of electric power systems (EPS).

How energy storage systems affect power supply reliability?

Energy storage systems are increasingly used as part of electric power systems to solve various problems of power supply reliability. With increasing power of the energy storage systems and the share of their use in electric power systems, their influence on operation modes and transient processes becomes significant.

What is a technologically complex energy storage system (ESS)?

Also, technologically complex ESSs are thermochemical and thermal storage systems. They have a multifactorial and stage-by-stage process of energy production and accumulation, high cost and little prospect for widespread integration in EPS in the near future [,,].

In the process of integrated energy system planning, there are numerous uncertainties in the various aspects of system planning for source, network, load, and storage due to the large differences in load demand, resource environment, and energy environment in different regions [14]. At the same time, considering the coupling mechanism between ...
