Direct current (DC) system flywheel energy storage technology can be used as a substitute for batteries to provide backup power to an uninterruptible power supply (UPS) system.

Since only around 6% of the 3-phase UPS systems in the market are flywheel UPS systems, the technology behind the units may not be understood. However, there has been a steady growth in the flywheel energy storage market as technology has improved. A flywheel is essentially a rotating mass that spins at incredible revolutions per minute (RPM).

Besides, because of their high power density and fast response time, typical applications of FESSs also include uninterrupted power service (UPS), hybrid locomotives, ...

A flywheel device contains a rotary flywheel that spins at speeds of 37,000 RPM, converting electrical energy into stored kinetic energy. In a UPS application, if a power outage occurs, the flywheel converts the kinetic energy into DC power and sends it to the UPS, which supplies it to the facility as AC power.

Developing the optimal flywheel for a given application requires carefully balancing numerous factors. Increasing the rotational speed of the flywheel, for example, increases stored energy, but also increase the stress on the ...

Abstract: The development of flywheel energy storage(FES) technology in the past fifty years was reviewed. The characters, key technology and application of FES were summarized. FES have many merits such as high power density, long cycling using life, fast response, observable energy stored and environmental friendly performance.
