

What are the limits of graphene in supercapacitors?

Thus, supercapacitors based on graphene could, in principle, achieve an EDL capacitance as high as  $\sim 550 \text{ F g}^{-1}$  if the entire surface area can be fully utilized. However, to understand the limits of graphene in supercapacitors, it is important to know the energy density of a fully packaged cell and not just the capacitance of the active material.

Are graphene supercapacitors a viable alternative to lithium-ion?

There's still work to do before graphene supercapacitors can hold their charge for long enough to be a practical alternative to lithium-ion for most applications, however. Some have suggested hybrid systems - supercapacitors for fast-charging, with traditional batteries for long-term storage.

Can graphene be used as a supercapacitor electrode?

Graphene in various forms, including reduced graphene oxide, functionalized graphene, graphene doped with heteroatoms like nitrogen or iodine, and composites of graphene with transition metal oxides or polymers, have been widely designed and investigated as the supercapacitor electrodes (Ke and Wang, 2016).

Are graphene-based materials suitable for supercapacitors and other energy storage devices?

The graphene-based materials are promising for applications in supercapacitors and other energy storage devices due to the intriguing properties, i.e., highly tunable surface area, outstanding electrical conductivity, good chemical stability and excellent mechanical behavior.

Why are graphene-based supercapacitors more expensive?

Graphene-based supercapacitors are more expensive. Because graphene-based supercapacitors are a newer technology, their production has not yet reached economies of scale. Furthermore, due to more stringent quality requirements, graphene continues to be more expensive to produce than activated carbon.

Can a graphene supercapacitor be used as a pressure sensor?

In another 2022 study, a group at Imperial College London developed a knitted graphene supercapacitor. When used as a pressure sensor, it showed a rapid response time of only 0.6 seconds, but its capacitance decayed to about 90% after only 10,000 cycles. Lithium-ion hybrid supercapacitors Figure 5.
