Why is heat pump and thermal energy storage important?

Heat pumps and thermal energy storage for heating TES is very important in HP systems since it decreases the thermal capacity to less than the maximum heating requirement and enables a larger share of renewables. It balances system operation and allows an HP to operate at full capacity throughout the year, hence the SPF increases.

Why should you use a heat pump?

Heat pumps are considered as easy to use while utilizing the possibility of bringing low-temperature heat sources to a higher temperature. Thus, low-grade renewable energy sources (such as air, water, ground, solar), as well as waste heat sources, can be used to reduce the demand for fossil fuels and greenhouse gas emissions.

How does a heat pump work?

Heat pumps are devices that use electricity or other energy sources to extract heat from a low-temperature source (such as the air, ground, or water) and transfer it to a high-temperature source (such as a building or a hot water tank).
