

What are the power flow control strategies in heterogeneous battery energy storage systems?

A comparison of five power flow control strategies in heterogeneous battery energy storage systems based on two distinct application-oriented scenarios is carried out. Power flow control strategies are assessed by two target indicators, namely performance and efficiency. A simulation model is set up and components are validated with measurements.

How does battery storage affect power systems?

The effects of battery storage on power systems have been explored in many countries 8, 9, 10, 11, 12, 13, such as the US, EU, Australia, and India. While the benefits of battery storage are clear, deployment strategies involve complex energy, economic, and emission trade-offs.

Are battery storage deployment strategies important?

While the benefits of battery storage are clear, deployment strategies involve complex energy, economic, and emission trade-offs. Some studies 14, 15, 16, 17 highlight the importance of battery storage deployment strategies and their location in power systems.

Why is battery storage important?

Battery storage allows rapid energy discharges to smooth fluctuations in electricity supply. It also offers substantial storage capacity and can be deployed in various locations and strategies. Furthermore, the cost of battery storage has decreased rapidly in recent years, making it economically feasible for large-scale deployment.

What is demand-side battery storage?

Demand-side battery storage is deployed in local power grids and connected to demand loads, such as industrial parks or commercial buildings, usually to act as an emergency energy source and to achieve power arbitrage.

Are re-connected and demand-side battery strategies effective?

We find that the effects of the RE-connected and Demand-side battery strategies mainly depend on the characteristics of provincial energy generation and demand. We observe that certain provinces' total local power generation exceeds their total demand; we refer to these provinces as supply provinces.

Several control strategies were proposed for power sharing and/or energy balancing of heterogeneous energy storage systems in microgrids [22, 34, 35, 39, 40], in hybrid ship [36] and in electric vehicles [37, 38]. Nonetheless, for example in Ref. [34] only one battery was considered and its SoC was regulated. Also, decentralized energy ...

Owing to the intermittency of the renewable generation and constantly changing load demand, the battery energy storage systems (BESSs) have become a required solution to future power systems. In this study, the

BESS is modelled as an agent. The authors propose an event-trigger finite-time consensus approach to maintain the supply-demand ...

Due to the rising penetration of renewable energy sources (RES)s and electrical vehicles over the last decades, distributed multiple battery energy storage systems (BESSs) have played an important role in microgrid management and operation [1], [2], [3] effectively charging and discharging to balance intermittent power output and time-varying load demand, ...

This paper is concerned with the distributed secondary control problem of multiple battery energy storage systems (BESSs) in an islanded microgrid, where the dynamics of each battery is heterogeneous. It is assumed that each battery can communicate with its neighbors via communication networks whose communication topologies are switching over time. A ...

This paper proposes a hierarchical control strategy to coordinate battery energy storage devices based on a multi-agent system. The heterogeneous nature of the battery volume is paid much more attention in designing the proportional ...

This paper is concerned with the distributed secondary control problem of multiple battery energy storage systems (BESSs) in an islanded microgrid, where the dynamics of each battery is heterogeneous. It is assumed that each battery can communicate with its neighbors via communication networks whose communication topologies are switching over time.

Battery systems are the most common means of storing electrical energy. There is currently an acceleration of the transition from fossil fuel-based internal combustion (IC) engines to electrified vehicles (EV), where Lithium-ion batteries (LIB) are at the forefront, and they play a strategic role in the actual green energy conversion [1]. There is an increase in the usage of ...

This letter proposes a distributed secondary control for heterogeneous battery energy storage systems (BESSs) to achieve finite-time consensus in frequency and active power while maintaining a balanced energy-level. The proposed scheme incorporates heterogeneity in electrical as well as control aspects and models heterogeneous BESS-based islanded AC ...

Several recent advances on distributed event-triggered consensus design for heterogeneous BESSs have been reported. The event-triggering functions for power sharing ...

This paper proposes a distributed voltage regulation method by sharing the power of distributed heterogeneous battery energy storage systems (BESS) properly. With the help of local voltage/power droop controller, BESS absorbs power from LVDN when nodal voltage is above the upper limit, and injects power to LVDN when nodal voltage is lower than ...

Abstract: This article addresses the problem of distributed resilient finite-time control of multiple

heterogeneous battery energy storage systems (BESSs) in a microgrid subject to denial-of-service (DoS) attacks. Note that DoS attacks may block information transmission among BESSs by preventing the BESS from sending data, compromising the devices and jamming a ...

Our novel consensus-based method is implemented to achieve energy level balancing, active/reactive power sharing, and voltage/frequency synchronization of energy ...

For battery energy storage systems (BESSs) in islanded AC microgrids, distributed control strategy provides an effective and flexible means to implement frequency restoration, proportional active power sharing and state of charge (SoC) balancing. Nevertheless, the distributed control system is susceptible to potential cyber attacks that break the ...

Abstract: This paper proposes a distributed control architecture for battery energy storage systems (BESSs) based on multi-agent system framework. The active/reactive power ...

To motivate the work we consider an energy storage system (ESS) connected to the low voltage (400 V) AC-grid. The ESS comprises BMW i3 batteries at various levels of ...

The Pb-acid batteries packs will be used as a fixed power source instead of APU to provide power for airport ground services. The lithium-ion batteries packs work as mobile power sources and provide dynamic support for the aircraft fleet. ... Furthermore, the heterogeneous energy storage, both fixed energy storage system (FESS) and mobile ...

Smart Grid 10(4), 3675-3686 (2019) Article Google Scholar Hu, J., Lanzon, A.: Distributed finite-time consensus control for heterogeneous battery energy storage systems in droop-controlled microgrids. IEEE Trans. Smart ...

This paper investigates the consensus control problem for heterogeneous battery energy storage systems (HBESSs) with switching topologies. An attack-resilient distributed control scheme is proposed to realize active/reactive power sharing, energy level balancing and frequency/voltage restoration within fixed-time. Rigorous proofs derive the convergence time upper bound for ...

This paper provides a distributed control strategy for battery energy storage systems (BESS) based on multi-agent system. The proposed control laws can guarantee that the state of charge (SoC) is synchronized, and BESS active power can be shared proportionally. ... Distributed finite-time consensus control for heterogeneous battery energy ...

This paper has presented a systematic analysis of five different power flow control strategies in heterogeneous multiple battery energy storage systems based on two distinct ...

This paper addresses the problem of distributed secondary control for islanded AC microgrids with external disturbances. By using a full-order sliding-mode (FOSM) approach, voltage regulation and frequency restoration are achieved ...

This article addresses the problem of distributed resilient finite-time control of multiple heterogeneous battery energy storage systems (BESSs) in a microgrid subject to denial-of-service (DoS) attacks. Note that DoS attacks may block information ...

A heterogeneous energy storage system (HESS) is implemented to combat the DC bus voltage instability and power allocation problem caused by high penetration of renewable energy sources (RESs) in a standalone DC microgrid. The HESS comprises a battery and supercapacitor aims to smooth DC bus voltage.

Abstract: This paper proposes a hierarchical control strategy to coordinate battery energy storage devices based on a multi-agent system. The heterogeneous nature of the ...

for Heterogeneous Battery Energy Storage Systems in Droop-Controlled Microgrids Guangyu Wu(B) Zhejiang Lab, Hangzhou, China mebest21@163 Abstract. This paper investigates a fully distributed adaptive consensus protocol to achieve leader-follower consensus for battery energy storage systems (BESSs) based on multi-agent system ...

A battery energy storage system (BESS) can reduce peak electricity demand in distribution networks. Quasi-dynamic load flow analysis (QLFA) accurately assesses

Distributed resilient finite-time secondary control for heterogeneous battery energy storage systems under denial-of-service attacks. IEEE Trans. Ind. Inform., 16 (7) (2020), pp. 4909-4919. Crossref View in Scopus Google Scholar [20] Das Milton Kumar, Bera Parthasarathi, Sarkar Partha Pratim.

A distributed finite-time secondary control scheme is proposed to ensure frequency regulation, active power sharing and energy level balancing of BESSs in a finite time, while operational constraints can be satisfied at any control transient time. This paper is concerned with the distributed secondary control problem of multiple battery energy storage systems (BESSs) ...

To circumvent this issue, heterogeneous designs for batteries have been explored, which include heterogeneous structures that vary in mechanical strength, pore size/porosity, ... The demand for high-energy-density Li/Na metal batteries for transportation, energy storage, and electronic products is increasing rapidly. However, the uncontrollable ...

This research proposes a methodological framework that effectively and efficiently identifies Pareto-optimal solutions of power flow control strategies (PFCSSs) in heterogeneous ...

Abstract: Based on the consensus theory of multi-agent systems (MAS), this article proposes a distributed

fixed-time control strategy for heterogeneous battery energy storage systems (BESSs) in droop-controlled microgrids. The droop control of microgrids creates frequency deviations from the target value, leading to decreased accuracy of power sharing and frequency.

Owing to the intrinsic advantages of high safety, high theoretical capacity (820 mAh g⁻¹ and 5855 mAh cm⁻³), low potential (- 0.762 V versus the standard hydrogen electrode (SHE)), low cost, and high earth abundance [[1], [2], [3]], aqueous Zn ion batteries are expected to be the most competitive candidate for intrinsically safe energy storage.
