A variety of applications have recently become involved in Cool Thermal Energy Storage or CTES for refrigeration applications, including food storage, process cooling and air conditioning systems. Phase change materials offer desirable thermal properties that are ideal for air conditioning applications.

Why do thermal storage systems use MGA technology?

MGA (Molten Glass Alkali) materials are used in thermal storage systems because of their high thermal conductivity and the fact that they remain macroscopically solid throughout their thermal cycle. Designs for thermal storage systems using MGA technology are quite different from those used for the industry standard, molten salt sensible heat storage.
