Swedish household end-users have been increasingly opting for a time-of-use electricity pricing contract [6]. The total electricity price consists of three main parts: electricity fee, network fee, and taxes [7]. With an hourly pricing contract, the electricity fee for end-users becomes variable by hour, in large part determined by the wholesale electricity trade price on ...

To compare performance among different electrochromic materials and devices, researchers use the coloration efficiency as a key parameter. Coloration efficiency (CE) is given by $(1) CE (l) = DOD / Q = \log(T_b / T_c) / Q$ where Q is the electronic charge inserted into or extracted from the electrochromic material per unit area, DOD is the change of optical density, ...

Kim developed an adaptive multiple MPC for energy management of a chiller system with thermal energy storage tank [49]. The simulation results indicate 5 ~ 13% energy saving can be achieved. Beghi et al., developed a non-linear MPC for a chiller system with ice thermal energy storage systems [50]. The simulation results indicated 30 ~ 35% ...

It is clear from the discussions that the PTES system incorporates a heat pump cycle for charging or energy storage and a heat engine cycle or power cycle for the discharging of the system to utilize the stored energy. The most commonly used storage configuration is a two-tank system employing sensible heat storage.

Compressed air energy storage (CAES) systems are being developed for peak load leveling applications in electrical utilities, and considered as an effective method for energy storage to deliver several hours of power at a plant-level output scale [7]. A CAES system stores energy by employing a compressor to pressurize air in special containers or natural reservoirs ...
