There is growing acknowledgement of the potential viability of pumped hydro energy storage solutions, despite multiple barriers for large-scale installations.

What is pumped hydro storage?

Pumped hydro storage is the world's largest,most proven and cost-efficient long-duration electricity storage technology. It uses excess electricity during off-peak hours to pump water from a lower reservoir to an upper one. This stored energy can then be released by allowing the water to flow back down through turbines to generate electricity when demand is high.

Is pumped hydro storage key to our future success?

Pumped hydro storage is key to our future success, as evidenced by the UK Government's consultation in January 2024. The Department for Energy Security and Net Zero (DESNZ) is exploring ways to unlock investment in long-duration electricity storage.

Can pumped-hydro storage save the environment?

As David Havard points out, projects around the world have shown that spoil can be managed and environmental footprint minimised. "And because pumped-hydro storage allows the grid to absorb more renewables, it helps keep 'green energy' truly green." This is part of an Introduction to Pumped Hydro series sponsored by GE.

Are batteries cheaper than pumped hydro?

Batteries are rapidly falling in price and can compete with pumped hydro for short-term storage (minutes to hours). However, pumped hydro continues to be much cheaper for large-scale energy storage (several hours to weeks). Most existing pumped hydro storage is river-based in conjunction with hydroelectric generation.
