What is the source of heat in a Solar Thermal Storage system?

STSS are TES systems where the source of heat is provided by the solar field, capturing the excess of energy not directly converted into power or other useful utility. As such, most TES technologies known can be adapted and have been adopted in solar applications, in particular for power production.

What is solar thermal storage?

Solar thermal storage (STS) refers to the accumulation of energy collected by a solar field for its later use. In the context of this chapter, STS technologies are installed to provide the solar plant with partial or full dispatchability, so that the plant output does not depend strictly in time on the input, i.e., the solar irradiation.

How does thermal energy storage work?

Thermal energy storage provides a workable solution to this challenge. In a concentrating solar power (CSP) system, the sun's rays are reflected onto a receiver, which creates heat that is used to generate electricity that can be used immediately or stored for later use.
