Are lithium-ion batteries the future of energy storage?

As these nations embrace renewable energy generation, the focus on energy storage becomes paramount due to the intermittent nature of renewable energy sources like solar and wind. Lithium-ion (Li-ion) batteries dominate the field of grid-scale energy storage applications.

Are lithium-ion batteries suitable for grid-scale energy storage?

This paper provides a comprehensive review of lithium-ion batteries for grid-scale energy storage, exploring their capabilities and attributes. It also briefly covers alternative grid-scale battery technologies, including flow batteries, zinc-based batteries, sodium-ion batteries, and solid-state batteries.

Why are lithium-ion batteries important?

Among various battery technologies, lithium-ion batteries (LIBs) have attracted significant interest as supporting devices in the grid because of their remarkable advantages, namely relatively high energy density (up to 200 Wh/kg), high EE (more than 95%), and long cycle life (3000 cycles at deep discharge of 80%) [11, 12, 13].

Are lithium-ion batteries a viable alternative battery technology?

While lithium-ion batteries, notably LFPs, are prevalent in grid-scale energy storage applications and are presently undergoing mass production, considerable potential exists in alternative battery technologies such as sodium-ion and solid-state batteries.

Are lithium-ion batteries energy efficient?

Among several battery technologies, lithium-ion batteries (LIBs) exhibit high energy efficiency, long cycle life, and relatively high energy density. In this perspective, the properties of LIBs, including their operation mechanism, battery design and construction, and advantages and disadvantages, have been analyzed in detail.

Are lithium-ion batteries critical materials?

Given the reliance on batteries, the electrified transportation and stationary grid storage sectors are dependent on critical materials; today's lithium-ion batteries include several critical materials, including lithium, cobalt, nickel, and graphite.<sup>13</sup> Strategic vulnerabilities in these sources are being recognized.
