

What are the economic benefits of microturbine with new combustor?

The economic benefits are given for the microturbine with new combustor. The ever-increasing demand on highly efficient decentralized power generation with low CO₂ emission has made microturbines for power generation in micro gas turbine (MGT) systems popular when running on biofuels as a renewable source of energy.

What is a microturbine system?

A microturbine, or micro turbine, is a power generation system based on the combination of a small gas turbine and a directly driven high-speed generator. In many cases, a gas turbine includes an exhaust gas recuperator that improves the efficiency of the system.

How much does a microturbine cost?

Each offers different models of microturbines that vary based on the power output that is needed. Based on estimates by the Gas Research Institute and National Renewable Energy Laboratory, the total plant cost varies from about \$2,600 per kW for a 30 kW system to around \$1,800 per kW for a 100 kW system.

How does a microturbine generator work?

In this mode, the microturbine generator is turned on and supplies power to the critical AC bus through LCM2. Typically, this microturbine will also be part of a CHP or CCHP system providing high-efficiency power that can reduce customer energy requirements.

How much energy does a microturbine produce a year?

Using the biogas produced from the WWTP's anaerobic digesters, the microturbines produced 2,300 megawatts (MW) of electricity annually which translates to energy cost savings of \$78,000. The microturbines also produced 84,000 therms of heat, which is equivalent to \$60,000 in prevailing natural gas rates.

What is a microturbine (MT)?

A microturbine (MT) is a small gas turbine with similar cycles and components to a heavy gas turbine. The MT power-to-weight ratio is better than a heavy gas turbine because the reduction of turbine diameters causes an increase in shaft rotational speed.

To extract more power, an exhaust diffuser is added to create a sub-ambient pressure at the turbine exit. A single-shaft solution is preferred as any two-shaft solution results in an overall lower ...
