

Could mountains be used to build a battery for long-term energy storage?

A team of European scientists proposes using mountains to build a new type of battery for long-term energy storage. The intermittent nature of energy sources such as solar and wind has made it difficult to incorporate them into grids, which require a steady power supply.

What is mountain gravity energy storage (MGEs)?

Hunt and his collaborators have devised a novel system to complement lithium-ion battery use for energy storage over the long run: Mountain Gravity Energy Storage, or MGES for short. Similar to hydroelectric power, MGES involves storing material at elevation to produce gravitational energy.

Could a mountain gravity energy storage system be a solution?

One researcher proposes using a scheme called a Mountain Gravity Energy Storage (MGES) as a solution. Illustration: IIASA The system is very flexible, says Hunt, because you can easily alter the speed of the cables, increase the load, or change the number of vessels to meet varying energy demands.

How does Tennessee's Raccoon Mountain store energy?

The machines that turn Tennessee's Raccoon Mountain into one of the world's largest energy storage devices--in effect, a battery that can power a medium-size city--are hidden in a cathedral-size cavern deep inside the mountain. But what enables the mountain to store all that energy is plain in an aerial photo.

Could a landfill be a good site for a 500-megawatt Solar System?

Power and energy could be increased in steps, by adding more rails, motor-generators, and cars. The Yakamas think an old landfill on their reservation could be a good site for a 500-megawatt system, and have applied for DOE grants to study it.

Will long-duration storage save utilities?

It's possible utilities will be spared that choice by long-duration storage technologies that are still being developed. Pumped storage might be superseded by flow batteries, which use liquid electrolytes in large tanks, or by novel battery chemistries such as iron-air, or by thermal storage in molten salt or hot rocks.
