What is hydrogen storage pressure?

Hydrogen storage pressure is as low as 150 bar, eliminating the use of high pressure (700 bar) hydrogen storage. High hydrogen storage capacity (4-8 wt.%) resulted from the large surface area of porous structures. The cost of raw materials is relatively low. Figure 10. Hydrogen fuel on-board systems

Are carbon-based nanotubes a sorbent for solid-state hydrogen storage?

Carbon-based nanotubes have been a popular candidate as the sorbent for solid-state hydrogen storage due to the low density, high surface area, and high stability properties.
