

Oil and gas wells in the petroleum fields, either producing or abandoned, serve as potential sites for the extraction of geothermal energy. Moreover, the number of abandoned wells will increase in the future due to declining hydrocarbon reserves [20, 21]. Most wells reach sufficient depth and bottomhole temperature (BHT) suitable for thermal energy extraction [[21], ...

Advanced Geothermal Energy Storage systems provides an innovative approach that can help supply energy demand at-large scales. They operate by injection of heat collected from various sources into an existing well in low temperature subsurface to create an artificial and sustainable geothermal reservoir to enable electricity generation.

To reduce emissions in the oil and gas industry, several measures have already been implemented, such as limiting flaring, energy efficiency measures in the production process, CO₂ capture and storage (CCS), and alternative solutions for power generation [7]. Limitation of flaring is practiced on a wide scale, e.g., by installing gas transport infrastructure or gas ...

Thermal power generation in China accounts for more than 65 % of the total power generation, and the total carbon emissions of coal-fired power generation reached 3867 Mt CO₂ per year [1].
