

Are single-walled carbon nanotube/phase change material composites reversible?

Single-walled carbon nanotube/phase change material composites: sunlight-driven, reversible, form-stable phase transitions for solar thermal energy storage Adv. Funct. Mater., 23 (2013), pp. 4354 - 4360 Novel organic solar thermal energy storage materials: efficient visible light-driven reversible solid-liquid phase transition J. Mater. Chem.

Are polyurethane-based flexible and conductive phase change composites efficient?

Polyurethane-based flexible and conductive phase change composites for energy conversion and storage Recent advances in polyurethanes as efficient media for thermal energy storage A new strategy for air-stable black phosphorus reinforced PVA nanocomposites J. Mater. Chem.

What is a paraffin phase-change microcapsule for thermal insulation of exterior walls?

A type of paraffin phase-change microcapsule for thermal insulation of exterior walls was prepared by in situ polymerization of low-softening-point paraffin (46 °C) as core material and acrylic copolymer as shell.

What is the phase-change temperature and latent heat storage capacity of microcapsules?

The phase-change temperature and latent heat storage capacity of the microcapsules were 47.8 °C and 174 J/g, respectively.

How does pnf@pu composite sample store thermal energy during solar irradiation?

During solar irradiation, PNF@PU composite sample stores thermal energy in the form of latent heat within phase transition range and sensible heat below and above phase transition temperature as presented in Figure S13.

Can plasmonic heating be used for thermal energy storage?

Rapid charging of thermal energy storage materials through plasmonic heating Single-walled carbon nanotube/phase change material composites: sunlight-driven, reversible, form-stable phase transitions for solar thermal energy storage Adv. Funct.

Phase change material (PCM), as intelligent and efficient latent heat storage technologies, have emerged as promising options for thermal management [9]. PCM are uniquely capable of absorbing or releasing substantial amounts of heat while maintaining a relatively constant temperature during phase transitions [10]. PCMs have the advantages of high energy ...

Thermal reliability is qualitatively analyzed by subjecting PCM microcapsules to an extremely large number of repeated cycles of phase change, and after multiple cycles of melting and crystallization, change of thermal ...

The paraffin phase-change microcapsules obtained using the optimum synthesis condition were mixed in a metakaolin-based geopolymer coating at different proportions, and ...

PCMs are one of the most effective means of thermal energy storage, whose task is to change phase with increasing temperature, store thermal energy, and release this energy with decreasing temperature. ... (GB) into the paint and coating on mortar panels in the tropics. They selected 30 % PCM-paint and 20 % GB-paint formulations as the best ...

Phase change active thermal energy storage. ... During the natural cooling process, the cooling rate of Case 1-4 decreases, indicating that the energy storage and thermal insulation performance of the coating improves with the increase in MPCM mass fraction. However, when the mass fraction of MPCM exceeds 15%, the cooling curve of Case 5 ...

The thermal energy storage/release of PCMs depends on the melting enthalpy (ΔH_m) and crystallization enthalpy (ΔH_c), which the respective peak area can determine [24]. TD microcapsules showed a solid-to-liquid phase change at around 42 °C with a thermal energy storage capacity of 105 J/g (Table 1).

Space cooling systems depending on modern refrigeration techniques such as air conditioning and ventilation with low energy efficiency dramatically result in large energy consumption and massive greenhouse gas emissions (Cai et al., 2009; D'Oca et al., 2018; Pakdel et al., 2019). The proposal of passive thermal management systems without energy ...

The oil and gas pipeline transportation technology is the key to the surface production of oil field, and the pipeline insulation technology plays an important role in realizing the safe, stable and energy-saving transportation of crude oil. The composite energy storage pipeline with PCM not only has thermal insulation performance, but also can greatly prolong ...

Functional phase change materials (PCMs) capable of reversibly storing and releasing tremendous thermal energy during the isothermal phase change process have recently received tremendous attention in ...

Phase change materials (PCMs) have capacity to keep a significant quantity of energy in the form of latent heat when undergoing a phase transition, rendering them very ...

Phase change paint, bricks and greenhouse improve insulation for sustainability. This study addresses challenges associated with supercooling, phase separation, and ...

In the composite coatings, CuS nanofillers generate heat through solar energy, while PEG stores heat via the phase change process. Due to the phase change process of nanofillers and the low heat dissipation coefficient of composite coating, the composite ...

This study investigates a hybrid thermal insulation system for subsea pipelines. The insulation system combines a traditional insulation material, Aerogel, with a phase change material (PCM), paraffin wax, for thermal energy storage to better regulate fluid temperatures and improve flow assurance for subsea pipelines.

(1), the photothermal conversion efficiency of the coating after dyeing is about 68 %, which realizes the photothermal conversion and energy storage of the composite phase change coating. In order to determine the stability of the coating under long-time light exposure, three simulated solar irradiation cycle experiments were conducted on the ...

For thermal insulation coatings, solar reflectance is the theoretical basis for evaluating their cooling effect and the reflectance data of the material are essential for describing the ability of the coating to reflect solar energy. ... The best phase-change energy storage capacity of MPCM coatings is achieved when the ambient temperature is ...

resulting phase-change thermal energy storage coating characterized. Keywords Phase-change microcapsule, Paraffin, In situ polymerization, Thermal energy storage, Geopolymer coating Introduction Buildings account for as much as 45% of global energy consumption, playing an increasingly significant role.^{1,2} Phase-change energy storage ...

Phase change material (PCM) is an important tool to retain heat and cold when the aim is thermal energy storage. These materials have high latent heat values and they are capable of storing or releasing a large amount of energy during a phase change within minor temperature variations [9], [10] recent years, the combination of PU foams and phase change materials - ...

Materials to be used for phase change thermal energy storage must have a large latent heat and high thermal conductivity. They should have a melting temperature lying in the practical range of operation, melt congruently with minimum subcooling and be chemically stable, low in cost, non-toxic and non-corrosive.

The coating exhibited excellent phase change and thermal insulation performance. ... thermal insulation coating can effectively regulate the heat exchange between the human body and the surrounding environment, ... Thermal energy storage properties and thermal reliability of PEG/bone char composite as a form-stable phase change material.

Organic phase change materials (PCMs) have been widely studied for thermal management applications, such as the passive cooling of silicon photovoltaic (PV) cells, ...

Phase change materials (PCMs) store and release energy in the phase change processes. In recent years, PCMs have gained increasing attention due to their excellent properties such as high latent heat storage capacity, ...

The global contribution of buildings to energy consumption has been continuously increasing, amounting to between 20 % and 40 %, especially in China, which has doubled its building energy consumption with an average growth of 3.7 % in only 20 years [1, 2]. These facts indicate that an efficient way to reduce global energy consumption is to reduce energy ...

Developing aerogel fibers with good mechanical properties, excellent thermal insulation, and active heating abilities has great significance in realizing efficient personal thermal management. Herein, we report the fabrication of a multifunctional cellulose nanofibers/multiwalled carbon nanotubes aerogel fiber encapsulated with a thin sheath of ...

Phase change materials (PCM) with enhanced thermal conductivity and electromagnetic interference (EMI) shielding properties are vital for applications in electronic ...

Solar-thermal energy storage using latent heat of phase change materials (PCMs) offers renewable penetration in wide range of smart applications. The limiting solar energy ...

There is an increasing need to improve the energy efficiency of residential buildings all around the world. Providing thermal insulation to the external walls and ceilings is a common practice for this purpose. The combined use of phase change materials (PCM) and thermal insulation in building envelopes could potentially further promote the building energy efficiency ...

Climate change and energy issues represent significant global challenges, making advancements in efficient energy utilization and storage technologies increasingly urgent (Ali et al., 2024). Phase change materials (PCMs) are notable for their substantial latent heat storage capacity and their capacity to absorb and release thermal energy at a stable temperature.

Saturated fatty acids are one of the most commonly used PCMs and they possess excellent properties such as good chemical and thermal stability and environmental compatibility [6]. Among them, myristic acid as a saturated fatty acid class is characterized by high latent heat, inexpensive, and suitable temperature [7], and myristic acid has less deviation from phase ...

In this respect, Yan et al. [22] exploited an all-weather thermal management textile that integrates radiative thermal regulation with the storage and release of phase-change heat. Nevertheless, the duration of phase-change latent heat is limited as the addition of the PCMs quantity leads to leakage issues and diminishes solar reflectivity [23 ...

Architectural coatings containing phase change microcapsules are promising for building energy conservation and other applications, but their limited thermal reliability hinders broader use and development. In this study, a modified melamine resin phase change microcapsule with enhanced stability and high heat storage capacity was designed and ...

Phase change energy storage thermal insulation coating

The curve allows us to analyse whether the application of the reflective coating improves the thermal insulation of the roof. From the figure, it can be seen that the three-day maximum temperatures of the external surfaces without reflective coatings were 60.62 °C, 59.76 °C, and 62.45 °C, while the external surface temperatures of the models ...
