Are compressed air energy storage systems feasible?

Conceptual design studies have been conducted to identify Compressed Air Energy Storage (CAES) systems which are technically feasible and potentially attractive for future electric utility load-levelling applications. The CAES concept consists of compressing air during off-peak periods and storing it in underground facilities for later use.

How does a compressed air energy storage system work?

The performance of compressed air energy storage systems is centred round the efficiency of the compressors and expanders. It is also important to determine the losses in the system as energy transfer occurs on these components. There are several compression and expansion stages: from the charging, to the discharging phases of the storage system.

How many kW can a compressed air energy storage system produce?

CAES systems are categorised into large-scale compressed air energy storage systems and small-scale CAES. The large-scale is capable of producing more than 100MW, while the small-scale only produce less than 10 kW. The small-scale produces energy between 10 kW - 100MW .

What determines the design of a compressed air energy storage system?

The reverse operation of both components to each other determines their design when integrated on a compressed air energy storage system. The screw and scroll are two examples of expanders, classified under reciprocating and rotary types.

What are the advantages of compressed air energy storage systems?

One of the main advantages of Compressed Air Energy Storage systems is that they can be integrated with renewable sources of energy, such as wind or solar power.

What are the stages of a compressed air energy storage system?

There are several compression and expansion stages: from the charging, to the discharging phases of the storage system. Research has shown that isentropic efficiency for compressors as well as expanders are key determinants of the overall characteristics and efficiency of compressed air energy storage systems .

WUHAN, Jan. 9 (Xinhua) -- A compressed air energy storage (CAES) power station utilizing two underground salt caverns in Yingcheng City, central China's Hubei Province, was successfully connected to the grid at full capacity on Thursday, marking the official commencement of commercial operations for the power station.

The Compressed Air Energy Storage Principle. A CAES plant requires two principal components, a storage vessel in which compressed air can be stored without loss of pressure and a compressor/expander to charge the storage vessel and then extract the energy again. (The latter might in fact be a compressor and a separate expander.)
