Energy storage A hydro-pneumatic accumulator is a vessel which, in hydraulic circuits, is capable of storing a large amount of energy in a small volume. The hydropneumatic accumulator is a tank divided into two chambers by a flexible separator. One chamber is for fluid under pressure, the other for nitrogen gas.

Considering the hydraulic system, energy efficiency can be increased by reducing throttling losses and energy storage/re-utilization. There are two ways to store the potential/kinetic energies, including electric and hydraulic energy regeneration systems (EERS and HERS) [3, 4]. The EERS usually contains a hydraulic motor, generator, electric motor, supercapacitor, ...
