Can service stacking improve energy storage system integration?

Service stacking is a promising method to improve energy storage system integration. There are several interesting cases where service stacking is crucial. Frequency supportive services are the most common to add when expanding portfolios. There is no standard method to solve optimization of service portfolios.

What is a battery energy storage system?

Battery energy storage systems (BESS) can serve as an example: some are used for peak shaving or energy management of RES, while others focus on ancillary services or voltage support. Fig. 2. Classification of energy storage technologies. 2.1. Chemical energy storage 2.1.1. Batteries

Does service stacking increase the utilization of storage units?

It can be concluded that service stacking is a promising method to implement for storage operators to increase the degree of utilization of storage units. It may also be concluded that the increased need for ancillary services increases the opportunity for storage units to participate in markets for energy and ancillary services.

Can a grid connected energy storage system offer additional services?

By offering additional services in turns or in parallel with the main service it is possible to create important revenue streams. The aim of this review is to provide an up-to-date status of service stacking using grid connected energy storage systems by presenting current research and on-the-table ideas.

Why do we need energy storage systems?

In order to use as much as possible of the produced energy, energy storage systems (ESS) are suitable enablers to allow integration of more RES in the power system. As cities grow and industry expands new users will request to be connected to the grid. Also, users that are already connected might request more capacity to meet future demand.
