Solar energy and wind power supply are renewable, decentralised and intermittent electrical power supply methods that require energy storage. Integrating this renewable energy supply to the electrical power grid may reduce the demand for centralised production, making renewable energy systems more easily available to remote regions.

The next obvious question concerns the origin of current and additional energy supplies up to 2030. Again, an analysis of the EIA figures is revealing. In 2004, "non-carbon" sources of energy (nuclear and renewables)

accounted for 14% of total global energy production, the balance being from the basket of fossil fuels (coal, oil and gas).

With increasing numbers of electric vehicles (EVs) and growth in electricity demand it is expected that the electricity supply system will come under strain, particularly with respect to peak demand (Aguilar Dominguez et al., 2020). Growth in electricity supply is, in turn, expected to be more reliant on renewable energy sources (RES), notably highly variable ...

In 2020, 60% of China's domestic lithium supply came from lithium spodumene and lithium lepidolite mines [60]. Although domestic supply has also increased, China's import dependency on minerals (ratio of imports to the sum of imports and domestic production) remained at a high level during 2015-2021, ranging from 75% (in 2020) to 88% (in 2018).

What is the domestic energy storage vehicle? In the realm of contemporary energy solutions, 1. domestic energy storage vehicles are specialized electric vehicles (EVs), 2. designed to store energy for residential usage, 3. equipped with advanced battery systems that allow for bi-directional charging, 4. integrated into smart grid technologies for enhanced energy management.
