

Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($< 10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

What are phase change materials (PCMs) for thermal energy storage applications?

Fig. 1. Bibliometric analysis of (a) journal publications and (b) the patents, related to PCMs for thermal energy storage applications. The materials used for latent heat thermal energy storage (LHTES) are called Phase Change Materials (PCMs).

What are the selection criteria for thermal energy storage applications?

In particular, the melting point, thermal energy storage density and thermal conductivity of the organic, inorganic and eutectic phase change materials are the major selection criteria for various thermal energy storage applications with a wider operating temperature range.

Can PCM be used in thermal energy storage?

We also identify future research opportunities for PCM in thermal energy storage. Solid-liquid phase change materials (PCMs) have been studied for decades, with application to thermal management and energy storage due to the large latent heat with a relatively low temperature or volume change.

Are inorganic PCMs a good choice for thermal energy storage?

Heat transfer enhancement Although pure inorganic PCMs possess relatively higher thermal conductivity (up to about $1 \text{ W/(m} \cdot \text{K)}$) than the pure organic PCMs, the thermal conductivity is still unacceptably low and this is one of the main drawbacks of their applications in many thermal energy storage systems.

How can phase change materials help a low carbon/green campaign?

Reutilization of thermal energy according to building demands constitutes an important step in a low carbon/green campaign. Phase change materials (PCMs) can address these problems related to the energy and environment through thermal energy storage (TES), where they can considerably enhance energy efficiency and sustainability.

the environment in the phase change range during a reverse cooling process. PCMs possess the ability of latent thermal energy change their state with a certain temperature. PCMs for TES are generally solid-liquid phase change materials and therefore they need encapsulation. TES systems using PCMs as

PCMs are functional materials that store and release latent heat through reversible melting and cooling processes. In the past few years, PCMs have been widely used in electronic thermal management, solar thermal storage, industrial waste heat recovery, and off-peak power storage systems [16, 17]. Inorganic salt hydrates in phase change materials (PCM) are important modern materials for latent heat storage at low temperatures (below 120 °C), which is conducive for the efficient use and saving of energy. However, inorganic salt hydrates still have some drawbacks, including high supercooling, phase separation, leakage, low thermal conductivity, and instability.

The storage of thermal energy as latent heat of a phase change material (PCM) represents a good attractive option to thermal energy storage. Wide ranges of PCMs have been investigated, including paraffin wax, salt hydrates, and non-paraffin organic compounds [1]. The economic feasibility of employing a latent heat storage material in a system depends on the ...

Reutilization of thermal energy according to building demands constitutes an important step in a low carbon/green campaign. Phase change materials (PCMs) can address these problems related to the energy and environment through thermal energy storage (TES), where they can considerably enhance energy efficiency and sustainability.

Phase change materials (PCMs) provide passive storage of thermal energy in buildings to flatten heating and cooling load profiles and minimize peak energy demands. They are commonly microencapsulated in a protective shell to enhance thermal transfer due to their much larger surface-area-to-volume ratio.

Energy storage with PCMs is a kind of energy storage method with high energy density, which is easy to use for constructing energy storage and release cycles [6] applying cold energy to refrigerated trucks by using PCM has the advantages of environmental protection and low cost [7].
