What are smart grids and why are they important?

Smart grids are one of the major challenges of the energy sector for both the energy demand and energy supply in smart communities and cities. They are crucial for providing ancillary services to electricity networks and play an important role in the development of smart grids. Grid connected energy storage systems are regarded as promising solutions for supporting smart grids.

Why is energy storage important in a smart grid?

EST can provide more balancing and flexibility to the power system, providing incorporation of intermittent RES to the smart grid. Energy storage technologies have a critical function to provide ancillary services in the power generation source for smart grid.

How does a smart grid work?

Smart grid coupled with energy storage systems increases demand elasticity while also disconnecting the simultaneity of production and consumption. Together, these services balance supply and demand while allowing a continual increase of renewables on the grid.

Can ESSs store electrical energy directly in an AC grid?

ESSs in an alternating current (AC) grid cannot store electrical energy directly. The energy storage devices currently available on the market are: battery energy storage systems (BESS), energy capacitor systems (ECS), flywheel energy storage systems (FESS). Figure 1 depicts the most important storage technologies for the power grid.

What services do grid connected energy storage systems provide?

Grid connected energy storage systems are regarded as promising solutions for providing ancillary services to electricity networks and to play an important role in the development of smart grids. The aim of the present article is to analyze the role of storage systems in the development of smart grids.

A microgrid is a small part of a power system which consists of parallel DGs, energy storage devices and electrical/heat loads. It can work in the grid-connected as well as the islanded mode, for providing uninterrupted service to customers, and for improving the reliability, operational optimality and power quality of the system [6], [7].

Nowadays, because of environmental concerns, energy management, improving reliability and enhancing resilience of distribution networks, DGs and MGs are taken into consideration more than ever. MGs include distributed energy resources, energy storage devices, and different loads that can be operated in grid connected mode or islanded one [1].
