Sodium-sulfur batteries differ from other regularly used secondary batteries due to their larger temperature operating range. Typically, these batteries function between  $250^\circ\text{C}$  and  $300^\circ\text{C}$  with molten electrode material and solid electrolyte [22] 1960, Ford Motor Company utilized sodium-sulfur batteries for the first time in a commercial capacity [23].

With sodium's high abundance and low cost, and very suitable redox potential ( $E(\text{Na}^+ / \text{Na})^\circ = -2.71 \text{ V}$  versus standard hydrogen electrode; only 0.3 V above that of lithium), rechargeable electrochemical cells based on sodium also hold much promise for energy storage applications.
