Why do we use sodium ion batteries in grid storage?

a) Grid Storage and Large-Scale Energy Storage. One of the most compelling reasons for using sodium-ion batteries (SIBs) in grid storage is the abundance and cost effectiveness of sodium. Sodium is the sixth most rich element in the Earth's crust, making it significantly cheaper and more sustainable than lithium.

Why is sodium a good choice for energy storage?

The extraction and processing of sodium exhibits a lower environmental impact in comparison with lithium. SIBs do not rely on cobalt or nickel, metals associated with significant environmental and ethical concerns. This makes SIBs a better sustainable choice for energy storage solutions aimed at supporting renewable energy integration.

Are sodium-based energy storage devices sustainable?

However, the performance and sustainability of current sodium-based energy storage devices mostly rely on various critical materials and traditional energy-consuming fabrication processes. Meanwhile, the detailed working mechanisms of some sodium-based energy storage technologies are still under debate.

Why is sodium a promising energy solution?

Sodium, characterized by its high energy density, efficient energy conversion, swift reactivity, and cost-effective storage and transportation, emerges as a promising energy solution.
