How to improve power quality and stability of MG system?

Arrangement of UPS or storage device is a nice idea to enhance the power quality and stability of the MG system. Since operating cost of storage devices will be high, so to overcome this issue, a new UPS system is designed to increase power quality with reduction in operating cost and without affecting total load supply demand.

Why are energy storage devices used in a microgrid?

Energy storage devices are used in a microgrid to maintain power balance during the transition period. This is necessary to ensure that the phase sequence and voltage magnitude can be synchronized with the grid once normal mode is restored. As power stations have a slow dynamic response, energy storage devices play a crucial role in mitigating power quality issues.

What are the challenges faced in power quality?

There are various challenges faced in power quality like microgrid power quality issues, sag/swell issues, harmonics, voltage unbalance and fluctuations. Microgrid (MG) is a combined system of self-governing small-scale power grids which consists of interrelated distributed energy resources and loads.

What devices improve grid stability and power quality?

The effectiveness of implementing devices such as Static Synchronous Compensators (STATCOM), Battery Energy Storage Systems (BESS), Dynamic Voltage Restorer (DVR), and Unified Power Quality Conditioners (UPQC) is evidenced by their contribution to the improvement of grid stability and enhancement of power quality.
