

What is stone storage and how does it work?

The idea is that when excess energy is produced by intermittent renewable sources like wind and solar, this energy is used to pump very hot air into the stone storage, where the energy in the form of heat can be stored for many days with very little loss on average.

How does the energy storage system work?

When there is a surplus of electricity from wind or solar, the energy storage system is charged. This is done by compressing heat energy from one or more storage tanks filled with cool stones to corresponding storage tanks filled with hot stones. The passage discusses the method of energy storage using GridScale's technology.

How long can heat be stored in a stone-filled tank?

The heat can be stored in the stones for many days. When there is demand for electricity again, the process reverses, so the stones in the hot tanks become colder while they become warmer in the cold tanks.
